Instructions

The opener is a device used by our veterinarians and rural epidemiologists for large livestock such as cattle. Binding method: After the animal is put down, the head limb binding method must be adopted, that is, a rope is inserted into the corner of the animal, a slip knot is pulled over the rope and tightened, and the free end of the rope is pulled back over the front joint. Pull it by the animals. The operator holds the opener in the left hand and inserts the opener iron tube into the animal's mouth. According to the size of the animal, a suitable stomach tube can be selected to insert the esophagus from the middle of the iron tube. After the rubber ball test, the funnel can be used to fill the medicine.
